

ENTERPRISE SEARCH

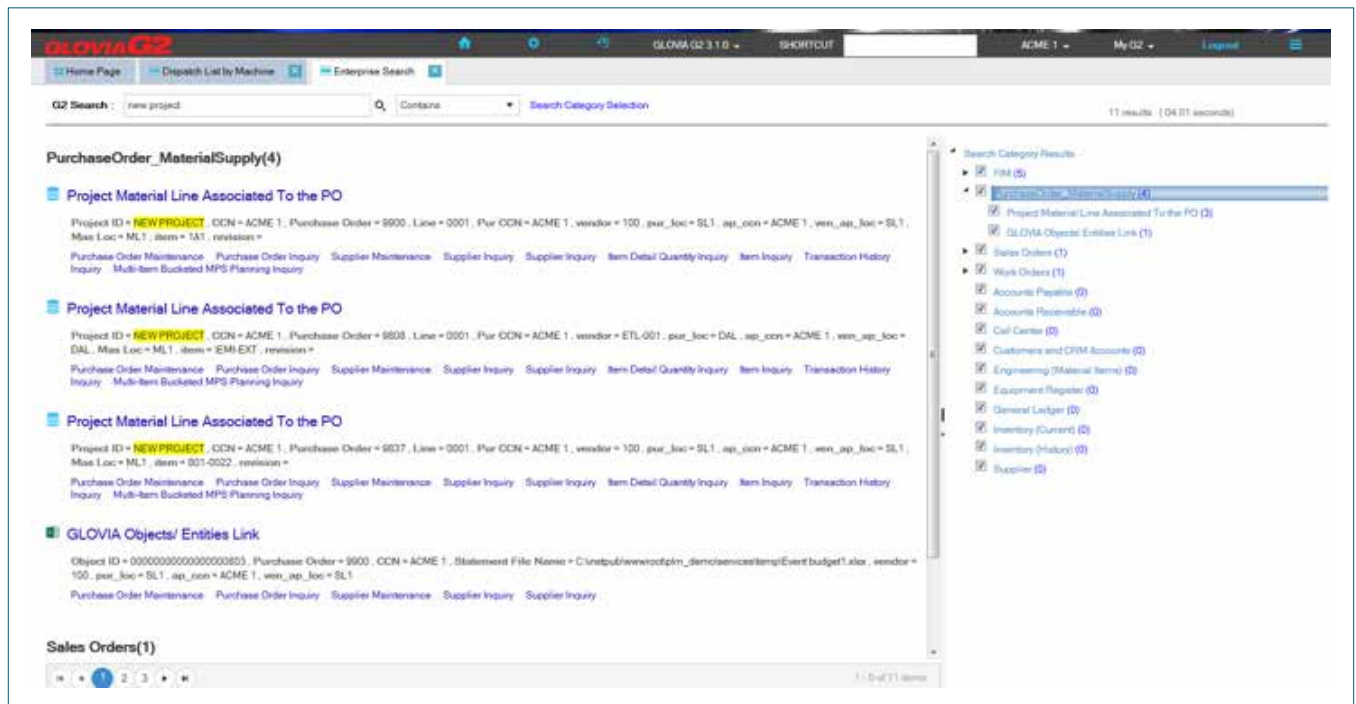

Maximizing User Productivity was our key consideration when creating this functionality; hence this search not only finds matching results for search criteria entered, but offers upload capabilities, data security, application filters, and functional links for each match found.

Search Feature

The first feature is an 'out of the box' solution for searching the 'core' data stored in the GLOVIA G2 database. Maximizing User Productivity was the key consideration in the design process; hence the search not only finds matching results for search criteria entered it provides:

- Data security that ensures users only see the data they normally have access to in GLOVIA G2
- Application filters and links that allow the user to minimize the displayed search results based on relevancy and/or to jump to the most relevant group of results
- Appropriate GLOVIA G2 functional links for each specific match found
- Functional security that ensures users only have access to the functions they normally have access to in GLOVIA G2

The second Enterprise Search Capability is a development tool that allows the Enterprise search results 'reach' to be extended to meet customer specific needs. Custom fields, tables and functions can be added to the search capabilities using this capability.

Function and Menu Search Capabilities

The search capability provides a solution for searching on all GLOVIA G2 function/menu shortcuts/names.

- Results include a one-click link to the function.
- Results include custom functions and menu's.
